Fluidized bed. A strong airflow is forced through a sandbed. The air seeps through the sand until a point is reached where the sand particles separate to let the air through and mixing and churning occurs, thus a fluidized bed is created and fuel and waste can now be introduced. The sand with the pre-treated waste and/or fuel is kept suspended ...

Using a fluidized bed reactor (Fig. 6.3) resolves some of the problems faced with a fixed bed reactor. This particular reactor offers a much more enhanced mass and heat transfer and minimizes temperature gradients throughout the reactor [64]. The mass and heat transfer are improved due to better mixing of the catalyst with the fluid, which provides a greater surface area for the reaction to occur.
