Diphtheria is a paradigm of the toxigenic infectious diseases. In 1883, Klebs demonstrated that *Corynebacterium diphtheriae* was the agent of diphtheria. One year later, Loeffler found that the organism could only be cultured from the nasopharyngeal cavity, and postulated that the damage to internal organs resulted from a soluble toxin. By 1888, Roux and Yersin showed that animals injected with ...

Hemolysis (from Greek αμύλυση, meaning 'blood breakdown') is the breakdown of red blood cells. The ability of bacterial colonies to induce hemolysis when grown on blood agar is used to classify certain microorganisms. This is particularly useful in classifying streptococcal species. A substance that causes hemolysis is a hemolysin
